

Performance Monitoring

What is it?

Performance monitoring provides continuous visibility into how your Oracle Fusion ERP and related business processes are running. It combines system monitoring, integration monitoring, and business KPI tracking to identify issues early—before they impact users, financial close, or operational workflows.

Value:

Most organizations rely on reactive support—they fix issues after users report them. Performance monitoring shifts the model to proactive operations. Benefits include:

- Actionable insights, not raw metrics
- Predictive alerts before failures
- Faster Root Cause Analysis
- Data-backed Oracle SRs
- Continuous performance optimization
- Data collected from Fusion, APM, ESS, logs
- Trend Analysis & Forecasting

Differentiators:

Oracle provides infrastructure and system health monitoring for the SaaS platform itself. R-Cubed's performance monitoring goes beyond platform uptime to focus on how the ERP system actually performs for your business, leveraging predictive analytics.

Oracle Monitoring

- Infrastructure uptime
- Platform availability
- SaaS system metrics
- Reactive alerts

R-Cubed Performance Monitoring

- ERP application performance
- Integration and job health
- Business process KPIs
- Proactive operational insights
